Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The with site of several key active site residues of ricin A chain by

The cream S.775-779(1992).

The rotein Brown S.775-779(1992).

The rotein synthesis through the catalytic inactivation of 60S protein specific adenine residue from an exposed loop of 28S ribosomal subvolved in the binding of elongation factorist the modified ribosomes are unable to support protein synthesis. The A chain can inactivate a few thousand ribosomes per minute, thus inactivating them faster than the cell can make new ones. A single A-chain molecule can herefore kill an animal cell againtination (Lectin activity). It binds to beta-D-

The coll again of the A chain, and cativity). It binds to beta-D-

The coll again of the cell again and cativity). It binds to beta-D-

-! SUBUNIT: Disulfide-linked dimer of A and B chains.
-! DOMAIN: The B chain is composed of two domains, each domain consists of 3 homologus subdomains (alpha, beta, gamma).
-! PIM: THE MANOR A-CHAIN IS GIYCOSYLATED DONLY IN POSITION 45 AND THE MINOR A-CHAIN IS GIYCOSYLATED ALSO IN POSITION 271.
-! SIMILARITY: IN THE N-TERRINAL SECTION, BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one

LEUT. J. BIOCHEM. 198:723-732(1991).

- I. FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN THE CATALYTIC INACTIVATION OF 60S RIBOSONAL SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSONAL SUBDINITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S RRNA. THE CHAIN IS A GALACTOSE-SPECIFIC IECTIN THAT FACLLITATES THE BINDING OF ABRIN TO THE CELL MEMBRANE THAT PRECEDES ENDOCYTOSIS.

- !- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S FRNA.

- !- SUBBUNIT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.

CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS, EACH DOMAIN CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS, BELING, BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.

CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS OF THE RIBOSOME-INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. -!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rBNA.
-!- SUBMIT: DISULFIDE-LINEED DIMER OF A AND B CHAINS.
-!- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN CONSISTS OF 3 HOWOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
-!- SIMILARITY: CONTAINS 2 ricin B-type lectin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (EC 3.2.2.21); ADTIN-D B CRAIN].

J. 309:285-298 (1995).
-!- FUNCTION: TRICHOSANTHIN IS AN ABORTION-INDUCING PROTEIN. IT IS CAPABLE OF INHIBITING HIV-1 INFECTION AND REPLICATION. IT INACTIVATES EUKRARYOTIC GOS RIBOSOMAL SUBUNITS.
-!- CATALYTIC ACTIVITY: Endobydrolysis of the N-glycosidic bond at one specific adenosine on the 28S TRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
-!- TYPE I RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chow T., Feldman R.A., Lovett M., Platak M.,

Bioconj. Chem. 5:423-429(1994).

-!- FUNCTION: RIBOSOME-INACTIVATING PROTEIN OF TYPE 1, INHIBITS PROTEIN SYNTHESIS IN ANIMAL CELLS (BY SIMILARITY).

-!- CARALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

-!- SIMILARITY: BLOOMS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RIPE BRYDI STANDARD; PRT; 282 AA.

Pharm. Bull. 39:1244-1249(1991).

-!- FUNCTION: ABORTION-INDUCING PROTEIN. IT INACTIVATES EUKARYOTIC
60S RIBOSOMAL SUBUNITS.

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S TRNA.

-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mizukami H., Iida K., Kondo T., Ogihara Y.; "Cloning and bacterial expression of a gene encoding ribosome-inactivating proteins, karasurin-A and karasurin-C, from Trichosanthes kirilowii var. japonica.";

     PROTEIN SYNTHESIS BUT DOES NOT AFFECT PLANT NOR BACTERIAL PROTEIN SYNTHESIS. THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 STRNA. THE B-CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT FACILITATES THE BINDING OF NIGRIN B TO THE CELL MEMBRANE THAT PRECEDES

-!- SUBUNIT: DISULFIDE-LINKED DIMEN OF A AND B CHAINS.
-!- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-!- SIMILARITY: IN THE N-TERNIAL, SECTION, BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
-!- SIMILARITY: Contains 2 ricin B-type lectin domains.

"Complete amino acid sequence of luffin-b, a ribosome-inactivating protein from sponge gourd (Luffa cylindrica) seeds.";
Agric. Biol. Chem. 55:229-238(1991).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
TYPE 1 RIP SUBFAMILY.

-! FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOWAL

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOWAL

SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S RRAM. THE

B CHAIN BINDS TO CELL RECEPTORS AND PROBABLY FACILITATES THE ENTRY

INTO THE CELL OF THE A CHAIN! B CHAIN'S ARE ALSO RESPONSIBLE FOR

CELL AGGLUTINATION (LECTIN ACTIVITY).

-! ATALYTIC ACTIVITY: Endobydrolysis of the N-glycosidic bond at one

specific adenosine on the 28S TRNA.

-! SUBUNIT: Disulfide-linked dimer of A and B chains.
                                                                                                                                                                                                                                                                                                           "Complete amino acid sequence of the A chain of mistletoe lectin I.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PHARMACEUTICAL: Due to its immunomodulative effects it is being studied in clinical trials in cancer patients as it may slow the growth of cancer cells and be an effective treatment for solid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- MISCELLANEOUS: TWO ISOFORMS OF MLA EXIST: GLYCOSYLATED FORM MLA AND NON-GLYCOSYLATED FORM MLA'.

"Genomic DNA Clone for mature typ-1 ribosome-inactivating protein from
"Genomic DNA Clone for mature typ-1 ribosome-inactivating protein from
Trichosanthes sp. sample 01 Bac Kan 8-98 Vien CNSH (Hanoi).";
Submitted (FEB-2000) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF THE N-GLYCOSIDIC BOND AT ONE
SPECIFIC ADENOSINE ON THE 28S RRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                       51
                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                               The invention covers analogues of Type I RIPs. Ricin is a Type II RIPs whose A chain is homologous to plant type I RIPs. The analogues of the invention have a cysteine available for intermolecular disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment.

(Updated on 09-JAN-2003 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                  Indels 10; Gaps
                                                                              AAR63902 is the ricin A chain gene product, it is analogous to the ribosome-inactivating proteins (RIPs) described in AAR63903-R63911. RIPs are the key components of cytcoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ricin A-chain ribosome inhibitory protein inactive precursor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                       AAW25136 represents a Ricin A-chain ribosome inhibitory protein (RIP)
which was engineered to contain a selectively removable internal peptide
linker sequence separating the alpha and bete units of the RIP. When
engared the two units regain and bete units of the RIP. When
exparated the two units regain and are capable of inactivating
cukaryotic ribosomes and hence preventing protein production. Many
different RIPs may be produced with an internal linker including
maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-chain and
Saporin. The RIPs can be used in the construction of therapeutic
toxins targeted to specific cells such as the
tatachment of a targeting polypeptide, e.g. a monoclonal antibody.
A further use is in HIV therapy (see US4869903). There is interest
in expressing RIP recombinantly in host cukaryotic cells, because of
the capacity to provide correct post-translational processing. However,
RIPs effectively inhibit protein synthesis in eukaryotic cells resulting
in cell death. Since the inactive RIP proteins are not cytotoxic to
then converted to active RIP proteins are not cytotoxic to
then converted to active RIP proteins.

The sequences given in AAW21698-710 represent Ribosome Inactivating
Proteins (RIP's), which may be used in the construction of the
Proteins (RIP's), which may be used in the construction of the
proxIP of the invention. The proxIP has a selectively removable,
contennal peptide linker. The precursor sequence is incapable of
inactivating eukaryotic ribosomes, but can be converted by removal
of the linker into a protein having alpha and beta fragments and being
capable of inactivating eukaryotic ribosomes. RIPs are potent
inhibitors of eukaryotic protein synthesis. They possess a highly
specific N-glycosidae activity which cleaves the glycosidic bond of
adenine 4324 of rat liver ribosomal 285 RNA. RIP's selectively inhibit
cellular proliferation of cells, e.g. cancer cells and HIV-infected T
cells. The inactive prokIP proteins make it possible to provide protein
synthesis inhibitors with uses in practical and improved ways not before
possible. The RIP can be used to make cytocoxic conjugates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     52 ELSNHAELSVTLALDVTNAYVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 111

The full-length sequences encoding ricin A (AAN70520), ricin D (AAN70525), putative ricin E (AAN70526) and RCA (AAN70524) in precursor form were obtted. using messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see Inbrary was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70522) shows the nucleotide sequences of three plasmids contg. cDNA inserts obtd. by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA inserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an ATG start codon and a HindIII site at the beginning of the mature protein (see AAN70518). The coding sequences of the inserts can be ligated into expression coding sequences of the inserts can be ligated into expression (AAN70523) and suitable retroregulators. (AAN70523) and suitable retroregulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          52 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 111

```
The immunotoxin given in AAR70827 comprises the heavy and light chain variable regions of anti-lens epithelium IgG3 MAb 4197X linked to ricin-A and a hexa-histidine tag. The DNA construct encoding the rimmunotoxin was expressed from pHB19 in E. coli. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Indels 10; Gaps

AAN90068) found on the EcoRI-HindIII fragment of DNA from Ricinu communis, Zanibariensis variety. Patent discloses many modifications of ricin in which the lectin binding function of the B chain is diminished or removed, and conjugation to toxins to eliminate cell binding. preproricin is the whole polypeptide encoded by AANS0202 and the DNA encoding this is claimed. Prozicin is obtained from preproricin by removal of the AA leader sequence. The linker AA sequence which is present in the precursor polypeptide is enzymatically removed in the cell to separate the A and B chains, which are joined by a disulphide bridge during the formation of the ricin molecule itself. This linker region as well as the presumptive amino terminal leader or signal sequence are not present in the sequences already published by Funatsu et al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  292..303

The sequence relates to preproricin protein encoded by the DNA sequence given in AA164137. The invention relates to a novel toxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The invention is useful for treating human immunodeficiency virus infected and other viral genome into the host genome thereby preventing the integration of the viral genome into the host genome thereby preventing the integration of the viral genome into the host genome thereby preventing the class those to act as host cells for the virus. The artiviral agent remains inert in a cell until degraded in it, unless the cell is infected with the virus, where the viral protease activates it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            52 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 111

                                                                                                                                                                                                                                                                                                                               The sequence relates to the amino acid sequence of a modified preproricin protein encoded by AA164145. The invention relates to a novel toxin (e.g. ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and viruside activities. The agent is able to enter all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell unless the cell is infected with the HIV virus, where the viral protease activates it. Ricin's mechanism of action is through inactivation of cellular ribosomes and cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, killing the cells upon infection and effectively preventing the latency/rebound viral genome into the host genome thereby preventing the latency/rebound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     85 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 144

The full length sequences encoding ricin A (AAN70520), ricin D (AAN70525) putative ricin B (AAN70526) and RCA (AAN70524) in precursor for form were obtained, using the messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521), shows the nucleotide sequences of three plasmids containing cDNA inserts obtained by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA inserts can be placed into expression vectors Site-directed mutagenesis may be used to place an ATG start codon and a HindIII site at the beginning of the mature protein, (see AAN70518). The coding sequences of the inserts can be ligated into expression coding sequences of the inserts can be ligated into expression (AAN70523) and suitable retroregulators.

DNA (see AAT91638) encoding the enzymatic A domain and a portion
of the A-to-B linker peptide of ricin was used to construct a
ricin-diphtheria toxin B'-interleukin-2 gene that was expressed in
E. coli. The hybrid protein can be isolated and used to treat
conditions involving over-production of cells bearing IL2 receptors,
such as certain T-cell lymphomas and organ transplant rejection
crises. The hybrid inactivates ribosomes in cells bearing IL2
receptors, resulting in cessation of protein synthesis and death of
target cells. Claimed hybrid proteins comprise a translocation
domain and a cell binding domain from e.g. a hormone, growth factor
or polypeptide toxin. The hybrid molecules can be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hybrid molecules for delivery of agents to cells - comprise a binding domain of a cell binding ligand and a portion of a

delivery of agents (e.g. therapeutic genes, toxins, detectable labels) into cells. The use of a translocation mechanism ensures that the hybrid will be effective in relatively low doses, since a high proportion of the substance of interest will be taken into the targeted cells. The hybrid molecules can be manufactured as a single hybrid recombinant protein, permitting reproducibility, consistency, and the precise control of composition.

Example 4; Fig 11; 31pp; English. \$

The invention relates to a recombinant DNA molecule encoding a hybrid protein comprising three parts: (a) the first part comprises a portion of protein comprising three parts: (a) the first part comprises a portion of the binding domain of a cell-binding polypeptide ligand allowing the hybrid protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein coxin, Tr toxin, Shiga-like toxin, pertussis toxin and tetamus coxin, which translocate the third part of the across the cytoplasmic toxin, which translocate the third part of the across the cytoplasmic comprise into the cytosol of the cell; and (c) the third part comprises a polypeptide entity to be introduced into the cell, which is non-mative to the naturally occurring protein of (b). This sequence represents the castor bean rich toxin sequence for use in generating the hybrid of the invention. The hybrid molecule enables the direction of appropriate therapy to affected cells, allowing them to function properly and calleviate or cure the disease. The hybrid is especially used in treating energy particular enzyme or a scarce precursor or cofactor, to directing toxins or other poisons to destroy particular cells (such as adipocytes, cancer cell, or virus infected.cells!), to counteracting viral infections such as complying the missing appropriate antibodies to viral proteins. It is also involved in the process of getting non-therapeutic substances such as complying the missing detains on the process of getting non-therapeutic substances such as construction in the process of getting non-therapeutic substances such as construction in the process of getting non-therapeutic substances such as constructions.

Sequence 27, Application US/08378761A
Patent No. 563534
GENERAL INFORMATION:
PAPLICANT: WALSH, TERENCE A
APPLICANT: MALCH ER
TITLE OF INVENTION: RIBOSOME-INACTIVATING PROTEINS, INACTIVE
TITLE OF INVENTION: PRECURSOR FORMS THEREOF, A PROCESS FOR MAKING A METHOD OF
TITLE OF INVENTION: USING
CORRESPONDENCE ADDRESS:
ADDRESSE: ANDREA T. BORUCKI
STREET: 9330 ZIONSVILLE ROAD
CITY, INDIANAPOLIS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 120
